

Long Bitcoin. Short the Dollar. Long Portugal.

You have Bitcoin. You don't want to sell it. You want European hard-asset exposure, euro yield, and a structure that compounds all three simultaneously. **The Bitcoin is posted as collateral — never sold — to borrow euros that acquire Portuguese real estate.** The spread between what Bitcoin does and what borrowing costs is the trade.

€25M MIN RAISE Floor for viability	€100M HARD CAP Full vision	6× BASE RETURN 10-year illustrative	60% BTC RESERVE Never sold	€11M PILOT ASSET Pebble Stone Farm
---	---	--	---	---

Important: For professional and well-informed investors only. Not a prospectus or securities offering. Return scenarios are illustrative — not forecasts. Capital is at risk, including total loss.

// 01 — THE THREE-LEG THESIS

Three bets. One machine.

Each leg hedges the others. Together they form a structure where the structural return is the spread between Bitcoin's long-run appreciation and a low, regulated borrowing cost — compounding against a backdrop of dollar debasement.

The Bitcoin is never sold.

This is not a fund that buys Bitcoin and sells it to buy property. The Bitcoin reserve is posted as collateral through regulated institutional channels to borrow euros at ~2–5% APR. The Bitcoin compounds untouched in regulated multisig custody. That spread — Bitcoin appreciation vs. borrowing cost — is the engine.

RESERVE ASSET · NEVER SOLD

Long Bitcoin.

The hardest monetary asset ever created. Continued monetisation — absorbing gold's market cap, gaining sovereign reserve footholds — is credible over a ten-year horizon. Historically 40–60% CAGR over four-year cycles. The principal risk is regulatory, not structural.

Historical 4yr cycle CAGR **40–60%** vs borrowing cost of **~3.5%**

DOLLAR SHORT · EUR ARBITRAGE

Short the dollar.

We borrow in dollars. We own in euros. Every 10% dollar devaluation reduces our real borrowing cost by 10% in EUR terms. At ~7%/yr dollar debasement, the nominal 3.5% loan becomes a **negative real rate**. The currency is paying us to borrow. \$39T federal debt. \$1T/quarter in interest. The path of least resistance is inflation — and inflation is on our side.

Nominal cost **3.5%** – dollar debasement **~7%/yr** = real cost **-3.5%**

HARD ASSET · YIELD GENERATING

Long Portugal.

Lisbon at €5–6K/m² vs. Paris at €10–12K. Supply constrained by licensing. Tourism infrastructure mature. Rental yields of 3–5% net. Euro-denominated and income-producing — a natural hedge against the dollar debasement thesis. Undervalued and supply-constrained.

Lisbon **€5–6K/m²** vs Paris **€10–12K** · Net yield **3–5%**

// 01 — THE THREE-LEG THESIS

The Dollar Decay Dividend.

Borrow in a dying currency, and your loan shrinks in real terms every year. Modelled on the €50M base case with a €12M loan.

// THE DOLLAR DECAY DIVIDEND — €50M BASE CASE · €12M LOAN

Borrow in a dying currency. Your loan shrinks in real terms every year.

Nominal loan outstanding (what you owe) vs real purchasing-power value of that loan (adjusted for ~7%/yr dollar debasement) · Illustrative · Not a forecast

A €12M nominal dollar loan taken at origination is worth only **€5.8M in real EUR terms by Year 10** — at 7%/yr dollar debasement. The **green shaded area is €6.2M the currency gave you for free**. That is more than half the original loan, and you never negotiated for it. It is structural, directional, and has been running for 20 years.

Why it matters: the fund's structural return does not depend on heroic assumptions. Bitcoin appreciation, dollar debasement, and Portuguese rental yield each contribute independently — and each is measured against a borrowing cost of ~2–5% APR that is included in every illustration in this memorandum.

// 02 — THE LEVERAGE ENGINE

Borrow against Bitcoin.

Buy Portuguese property. Repeat.

The Bitcoin reserve is not sold to fund acquisitions — it is posted as collateral through regulated channels to borrow euros, which acquire Portuguese real estate. The Bitcoin position compounds untouched.

The claim is not "free leverage."

The borrowing cost is real (~2-5% APR) and is included in every return illustration. The claim is that the spread between Bitcoin's long-run appreciation and a low, regulated borrowing cost is **structural and persistent across a cycle**. Conservative LTV is maintained at all times. Collateral health is monitored continuously with defined de-risking triggers.

A deal, end to end.

- 01 Capital in**
 Investor subscribes for convertible preferred shares. Share register (and on-chain mirror via bbrf-pt.eth) records the holding.
- 02 Reserve allocated**
 ~60% of committed capital allocated to Bitcoin reserve in regulated institutional custody. Bitcoin is not sold.
- 03 Conservative borrowing**
 Euros borrowed against the reserve at conservative LTV through regulated lending. ~2-5% APR indicative.
- 04 Advisory sources the deal**
 Top-tier institutional real estate advisor surfaces a deal, prepares full underwriting dossier — location, net yield, BTC-collateralised financing terms, exit scenarios.
- 05 Investment committee approves**
 Acquisition approved against defined criteria. Independent Portuguese valuation confirms pricing. Decision and rationale published to investors and recorded on-chain.
- 06 SPV closes the asset**
 Portuguese operating company closes the asset into a dedicated Lda. SPV. Clean liability ring-fencing and disposal optionality per asset.
- 07 Yield flows to investors**
 Net rental income distributed periodically in EUR/EURC after the preferred dividend and costs. Bitcoin compounds untouched.

// 02 — THE LEVERAGE ENGINE

One Lisbon apartment — the numbers.

A worked example of a single acquisition inside the structure. Illustrative only.

WORKED EXAMPLE · ILLUSTRATIVE ONLY				
One Lisbon apartment — the numbers				
ASSET	PRICE	BTC LOAN	OWN CAPITAL	ANNUAL YIELD
Lisbon apartment	€750,000	~€400,000	~€415,000	~€31,500
~4.2% net yield after mgmt	IMT + closing: ~€65K	~3.5% APR indicative	Covers price + costs	4.2% × €750K

What the structure adds on top of the yield.

LAYER 1	LAYER 2
Euro rental income	Portuguese appreciation
Net rental income services the loan and distributes to investors in EUR/EURC after the preferred dividend and costs.	2–4% annual appreciation assumed across scenarios, on a leveraged asset base of ~2–3× deployed capital.
LAYER 3	LAYER 4
Bitcoin reserve compounding	Dollar debasement
~60% of committed capital compounds untouched in regulated multisig custody for the life of the fund.	The dollar-denominated loan loses real value at the pace of dollar debasement — a structural tailwind on the liability side.

All four layers are compounding simultaneously on the same committed euro. That is the machine: **current yield + hard-asset appreciation + BTC reserve + liability decay**, netted against a ~2–5% APR borrowing cost.

// 03 — THE DATA

The spread is the trade.

Bitcoin historically compounds at 30–50% per year. The cost to borrow against it is ~3.5% APR. The dollar loses ~8% of purchasing power annually. The gap between those lines — over ten years — is the fund's core alpha.

// BTC APPRECIATION VS COST OF CAPITAL — 10-YEAR VIEW

One line shoots to the moon. Everything else stays flat.

Indexed to 1× at Year 0 · Illustrative CAGR assumptions · Not a forecast · All on the same axis

The trade in one number: BTC at 30% CAGR reaches 13.8× in 10 years. The cost to borrow against it at 3.5% APR reaches 1.4×. The spread — 12.4× gross — is the fund's structural alpha. The dollar is losing the race in both directions.

// 03 — THE DATA

60 / 40. Fixed.

Capital allocation per €1M committed. The BTC reserve is never sold; the real estate deployment is leveraged ~2-3× via the BTC-collateralised loan.

// CAPITAL ALLOCATION PER €1M COMMITTED

60 / 40.

- Bitcoin Reserve — never sold, held in regulated multisig custody
- Real Estate Deployment — leveraged ~2-3× via BTC collateral loan

// RETURN SCENARIOS · €1M COMMITMENT · 10 YEARS

One trade. Three outcomes.

Illustrative · Borrowing cost deducted · Not a forecast

Conservative assumes BTC ×6 over 10yr. Base assumes ×10. Upside assumes ×15. Portuguese RE appreciation and 3-5% net rental yield compound across all three. **Borrowing cost is deducted in all cases.**

// 04 — THE PILOT ACQUISITION

Pebble Stone Farm.

1,000 hectares. €11 million.

The first acquisition is identified — not hypothetical. Pebble Stone Farm is a 1,000-hectare hunting estate in Portugal's Alentejo. This is the proof-of-concept SPV through which the full stack is proven end-to-end before the institutional raise opens.

LOCATION

Alentejo, Portugal

Portugal's premier hunting and agricultural region

PRICE

~€11M / ~\$12M

Off-market · institutional scale · single title

SIZE

1,000 hectares

~2,471 acres of Alentejo estate

INCOME STREAMS

Hunting · Agriculture

+ Future hospitality optionality

STRUCTURE

Pilot SPV (Lda.)

Proof of concept before institutional raise opens

STRATEGIC ROLE

Full stack proof

Legal · custody · governance · yield — end-to-end

Why a pilot first.

The pilot SPV proves the legal structure, the custody arrangement, the BTC-collateralised lending relationship, and the governance stack at a manageable scale — before institutional capital is accepted. Founding investors who join before the pilot closes are compensated via preferred terms, not a discounted price.

// 05 - RETURN ILLUSTRATION

Three engines. Ten years. One compounding machine.

Returns are driven by Bitcoin appreciation on the reserve, Portuguese real estate appreciation, and rental yield. Illustrated on a €1M commitment. Not forecasts.

Illustrative only — not a forecast, projection, or guarantee. Each scenario assumes Bitcoin compounds, Portuguese real estate appreciates, leverage remains available at modelled cost, and the regulatory environment remains workable. Each can fail independently or together. Borrowing cost (~2–5% p.a.) is netted against acquisition leverage. Capital is at risk, including total loss.

We modelled the crash.

Here’s exactly where the structure breaks.

The most common investor question: "what happens when Bitcoin drops 80%?" Below is the exact answer — modelled on the €50M base-case raise: 350 BTC in reserve against a fixed €12M loan, at an origination price of €85,714 per BTC.

BTC MOVE	BTC PRICE	RESERVE VALUE	LTV	STATUS	RESPONSE
0%	€85,714	€30.0M	40%	● SAFE	No action. 25pp buffer before the first de-risking trigger.
-30%	€60,000	€21.0M	57%	● SAFE	Within designed parameters. Normal market volatility — no forced action.
-40%	€51,428	€18.0M	67%	▲ STAGE 1	Loan exposure cut 15% via partial RE sale or equity contribution. No Bitcoin sold.
-50%	€42,857	€15.0M	80%	▲ STAGE 2	Loan cut 30%. One SPV liquidated. Reserve intact.
-60%	€34,286	€12.0M	100%	🔴 STAGE 3	Margin call. RE assets liquidated to repay the loan. Bitcoin still not sold.
-80%	€17,143	€6.0M	200%	🔴 STAGE 3	All RE sold, €12M loan repaid from proceeds. BTC released from collateral — reserve intact, held by investors.

The de-risking waterfall — three stages before BTC is ever threatened

Stage 1 (LTV >65%): Management reduces loan exposure by 15% via partial asset sale or additional equity contribution. No Bitcoin sold.

Stage 2 (LTV >75%): Reduce by 30%. One SPV liquidated. Loan partially repaid. Reserve intact.

Stage 3 (LTV >85%): Full margin call response. Loan repaid via RE sale proceeds. Bitcoin still not sold unless all other options exhausted.

The Bitcoin is a last resort, not a first response. Conservative origination LTV and active monitoring are the primary protection.

Bitcoin has dropped 80%+ three times in its history. Each time, it recovered to new highs within 24 months. An interactive version of this stress test is available on the web memorandum at eytan.com/pitches/bbrf-pt.html.

// 07 - CAPITAL RAISE

Three tiers. One flywheel.

€25M minimum — below that, fixed overhead exceeds the structural alpha. The structure compounds: each acquisition deepens the portfolio, grows the Bitcoin reserve, and earns better deal access and financing terms for the next.

FLOOR - INSTITUTIONAL VIABILITY €25M BTC Reserve (~60%) €15M~175 BTC RE Deployment (~40%) €10M€20-30M leveraged 10-yr portfolio €120-160M	★ BASE CASE TARGET €50M BTC Reserve (~60%) €30M~350 BTC RE Deployment (~40%) €20M€50-70M leveraged 10-yr portfolio €280-380M	VISION - HARD CAP €100M BTC Reserve (~60%) €60M~700 BTC RE Deployment (~40%) €40M€100-140M leveraged 10-yr portfolio €600-850M
---	--	--

Who we're talking to.

BITCOIN-NATIVE FAMILY OFFICES €1M-€5M tickets LU · IL · PT · UAE. Want hard-asset exposure without selling the stack. Already think in BTC terms. This is their instrument.	INSTITUTIONAL & PROTOCOL TREASURIES €500K-€2M tickets Seeking real-world-asset exposure with transparent, on-chain reporting. Convertible preferred is a familiar structure.	QUALIFIED CRYPTO-NATIVE INDIVIDUALS €50K-€100K tickets Professional/well-informed only. Fractional Portuguese real estate with euro yield and a BTC reserve they can track.
--	---	--

// 07 — CAPITAL RAISE

Scale isn't linear. It's exponential.

Illustrative portfolio value by raise tier over ten years — BTC reserve compounding, leveraged RE appreciation, and rental yield reinvestment. Not a forecast.

// PORTFOLIO VALUE AT SCALE — 10-YEAR PROJECTION

A 4x larger raise delivers ~5x larger 10-year portfolio. Each additional euro raised compounds via the Bitcoin reserve, unlocks larger and better-financed deals, and earns improved leverage terms at institutional scale. This is the flywheel in numbers.

// 08 — THE STRUCTURE

A corporate structure. Not a token scheme.

Investors hold convertible preferred shares of a Luxembourg holding company. The on-chain layer is a transparency and identity feature — not the legal interest. The Bitcoin is never held on-exchange.

ISSUER · LUXEMBOURG

SOPARFI Holding Company

Issues convertible preferred shares. Holds the capital raised and the Bitcoin reserve. Owns Portuguese subsidiaries. EU participation-exemption regime.

RESERVE ASSET

Bitcoin Reserve

Regulated institutional custody. Multisig from inception. Never on exchange. Collateral for conservative dollar borrowing. Never sold.

OPERATIONS · PORTUGAL

Portuguese OpCo + SPVs

Sources, executes, manages acquisitions. One Lda. per asset for clean liability ring-fencing and disposal optionality.

TRANSPARENCY LAYER

bbrf-pt.eth · On-Chain

Tokenised share register, published governance and acquisition records. Evidentiary and reporting — does not alter legal rights of the preferred shares.

INDEPENDENT SERVICES

Professional Bench

Legal, fund admin, regulated custody, smart-contract audit, independent valuation — all external, bound by mandate. Five functions permanently independent.

INSTRUMENT

Convertible Preferred

1× non-participating liquidation preference. ~8% cumulative PIK dividend. Converts to common at qualified financing, sale, or listing.

Five functions permanently independent.

Legal counsel, fund administration, regulated custody, smart-contract audit, and independent valuation are all external and bound by mandate — none is performed by the principals.

Indicative instrument terms.

Terms are indicative and subject to definitive documentation prepared by Luxembourg counsel.

TERM	DETAIL
Security	Convertible preferred shares · Luxembourg holding company (SOPARFI)
Liquidation pref.	1× non-participating, senior to common
Preferred dividend	~8% per annum, cumulative, accruing (PIK) until conversion or liquidity event
Valuation	€100M pre-money (indicative) — priced now, not via cap/discount
Conversion	1:1 into common at qualified financing, sale, or listing; holder receives greater of conversion value or liquidation preference
Investor rights	Pro-rata participation, information rights, protective consents on major matters
Liquidity	12-month lock-up → quarterly redemptions up to ~10% of pool → secondary transfers from Year 2 → wind-down available from Year 8
Eligibility	Professional and well-informed investors only · Luxembourg private placement

The instrument is a **convertible preferred, not an equity valuation claim** — the €100M pre-money is the indicative conversion price, with a 1× liquidation preference protecting the downside and an 8% PIK dividend accruing until conversion.

// 09 – THE PRINCIPALS

Two principals. One assembled bench.

REAL ESTATE · MULTI-JURISDICTIONAL

Eytan Benzeno

Lisbon-based real estate principal. Florida broker licence. Operates across Portugal, Israel, Luxembourg, and the US. Multi-asset: residential, hospitality, distressed, agricultural. Co-founder of Bogen.ai. Multilingual.

Brings: deal sourcing · transaction execution · Portuguese market access · FO networks in LU/IL/PT/UAE

ON-CHAIN STRUCTURING & OPERATIONS · BITTREES

Jonathan Hinline

On-chain governance and operations architect. Designs the reserve-and-leverage mechanics, tokenised share register, and transparency layer. Deep network of smart-contract auditors and infrastructure engineers. Author of operational guidance for blockchain-native organisations (bittrees.eth.limo).

Brings: reserve mechanics · smart-contract design · blockchain engineering bench · crypto-native LP relationships

// 11 — THE HARD QUESTIONS

Five challenges.

Five honest answers.

Sophisticated investors will ask these questions. We have asked them of ourselves first. Below are the honest, complete answers — including the parts that are still open.

CHALLENGE 01

“What happens to the Bitcoin when it drops 80%?”

We modelled this — see the stress test on page 10. At 40% origination LTV, the reserve can absorb a ~38% BTC drawdown before the first de-risking trigger activates — and that trigger sells *real estate*, not Bitcoin. A staged waterfall (65% → 75% → 85% LTV) means management is responding actively long before a margin call threatens the reserve. BTC has dropped 80%+ three times in its history. Each time, it recovered to new highs within 24 months. **The risk is real. The mitigation is structural, staged, and transparent — and we are showing you the math, not asking you to trust us.**

Addressed — stress-tested, waterfall defined

CHALLENGE 02

“Why should I pay 20% carry on Bitcoin going up?”

You should not — and the structure is designed to reflect this. The 8% cumulative preferred hurdle must be cleared before the carry applies. The preferred liquidation preference (1×) protects investors on the downside. The carry compensates management for: sourcing and executing Portuguese real estate (illiquid, relationship-gated, bureaucratic); managing the BTC lending facility, LTV monitoring, and active de-risking; and operating the full Luxembourg SOPARFI + SPV legal structure across two jurisdictions. **The BTC is the collateral engine. The work is in the real estate and the risk management.** If you want pure BTC exposure, buy BTC. This instrument gives you BTC + leveraged EUR hard assets + institutional structure + preferred terms.

Addressed — carry is on the full structure, not the reserve alone

CHALLENGE 03

“Name the lender. Who is actually doing the BTC-backed loans?”

The formation process involves shortlisting regulated lending counterparties who can provide BTC-collateralised facilities to a Luxembourg entity. Target profile: regulated custodian-lenders (category includes Sygnum Bank, institutional Bitcoin-backed credit desks at regulated European banks, and specialist crypto prime brokers with EU licences). **We do not yet have a signed term sheet — this is an open item, and we are stating that clearly.** The pilot SPV (Pebble Stone Farm) will be used to establish and test the lending relationship at a manageable scale before the full institutional raise.

Partially open — lending counterparty is a formation-stage deliverable

CHALLENGE 04

“Strip out BTC appreciation. What’s the actual real estate return?”

Honest answer: the RE-only return is a respectable but unremarkable Portuguese property fund. ~40% of capital, leveraged ~2–3×, at 3–5% net yield, with 2–4% annual appreciation. That produces roughly 1.5–2× over 10 years before fees — a respectable euro return, but not why you're here. **The structural alpha lives in the BTC reserve compounding while the RE deployment earns you current yield and hard-asset exposure.** This is, at its core, a Bitcoin fund with a real estate income engine. If you are allergic to BTC volatility, this is not the right instrument.

Addressed — the BTC thesis is primary; the RE is the yield and diversification layer

CHALLENGE 05

“€100M pre-money with no assets — justify the valuation.”

The €100M pre-money is the indicative conversion price for the convertible preferred — not an assertion of current enterprise value. The 1× liquidation preference means investors get their money back before any conversion value is realised. The preferred dividend accumulates at 8% PIK. **The honest framing is: you are buying a protected entry into a structure at a pre-agreed conversion price, with downside protection via the liquidation preference, in exchange for providing formation-stage capital before the pilot SPV is closed.** The €100M figure will be validated or renegotiated based on what the pilot demonstrates.

Addressed — instrument is a convertible preferred, not an equity valuation claim

// 12 — FORMATION PLAN

Next 90 days.

Specific. Named. Accountable.

The following milestones are commitments, not aspirations. The founding investor round is open until Pebble Stone Farm closes. After that, terms move to institutional pricing.

Jul 2026 — Week 1

Engage Luxembourg counsel

Mandate a Luxembourg law firm to form the SOPARFI holding company and draft the convertible preferred share subscription agreement. Target: completed entity within 4 weeks.

Lead: Eytan Benzeno · Jonathan Himeline

Jul 2026 — Week 2

Engage Portuguese transaction counsel

Mandate a PT law firm specialising in agricultural real estate. Commence property title review on Pebble Stone Farm. Confirm SPV template (Lda. structure).

Lead: Eytan Benzeno · PT partner counsel

Jul-Aug 2026

Lending facility — shortlist and approach

Approach 3–5 regulated BTC-collateralised lending counterparties. Obtain indicative term sheets. Select primary lender. Begin KYC/AML onboarding for the Luxembourg entity.

Lead: Jonathan Himeline · crypto-native LP network

Aug 2026

Custody arrangement

Establish regulated institutional multisig custody for the Bitcoin reserve. Confirm custody provider, key-holder structure, and insurance arrangement. Publish custody policy to founding investors.

Lead: Jonathan Himeline · Bittrees engineering bench

Aug-Sep 2026

Pebble Stone Farm — pilot SPV close

Close the acquisition into the first Portuguese Lda. SPV. Prove legal, custody, lending, and governance stack end-to-end. Issue first convertible preferred shares to founding investors.

Lead: Eytan Benzeno + Rita Yang (Sócia-Gerente) · PT counsel

Q4 2026

Institutional raise — open

Appoint licensed placement agent in Luxembourg, Israel, and UAE. Publish pilot SPV performance data. Open the full raise to the €25M floor with institutional pricing.

Lead: both principals · licensed placement agent

The Bitcoin is never sold.

We're speaking with a small number of anchor investors and formation partners. If the thesis resonates, the conversation starts now.
